Customer Reviews

With the new recent version of Flash CS5, there are lots of new upates that Flash designers are looking forward to, mostly the improved ActionScript interface, better "bones" animation, improved text rendering, improved physics, better cur points for shape tweening, etc.All the new features are explained in detail in this new version of the every popular Adobe Flash book. The classroom in the book series has been the defacto standard in learning Flash and all its new version updates over
the years. This book is no different, the author goes through all the great new features and explains them beautifully and in great detail.

Table of contents:

Chapter 1: Getting Aquainted
Chapter 2: Working with Graphics
Chapter 3: Creating and Editing Symbols
Chapter 4: Adding Animation
Chapter 5: Atriculated Motion and Morphing
Chapter 6: Creating Interactive Navigation
Chapter 7: Using Text
Chapter 8: Working with Sound and Video
Chapter 9: loading and Controlling Flash Content
Chapter 10: Publishing Flash Documents

I really enjoyed chapter (lesson) 6 focusing on interactive navigation. No matter what web technology you use on the web, you always need a navigation system and this chapter really explains it well. The author first talks about the various methods flash designers/developers can create navigation menus with Flash and with other technologies (CSS and JavaScript) and then goes into the example that shows a really neat way of using interactive movies, invisible buttons and a little AS to create a cool looking, visually pleasing menu. The author also really explains ActionScript 3.0 very well when needed in certain chapters.

I'm pretty familiar with several of the Adobe Creative Suite programs, but I could never quite figure out Flash Professional, at least in the few times I opened it and tried to play around with it. On the one hand, it seems like a content design and animation program; on the other hand, it seems like it's a visual programming interface. Because of that, the timeline doesn't quite work the way you'd expect if you come to it from programs like Premiere Pro or After Effects. If you want to animate something, for example, you have to create what's called a "motion tween" and each animated object has to have it's own unique "motion tween" layer. Plus, layers work a bit differently than in other Creative Suite Programs like Illustrator or Photoshop. I knew I was in over my head, and did what I always do when I can't figure out a program: pick up a guide. I think it's helpful to have a broad overview before really trying things on my own, because then even if I don't remember everything from the overview I'll remember what's possible and know where to look when I'm stuck.
